This study aims to determine the effect of learning interest on students' learning outcomes in learning of sprinting class V at SD Negeri 112 Seluma. This research design uses a survey method with sampling techniques using total sampling with a sample size of 22 Respondents, Data analysis in this study used quantitative descriptive techniques with hypothesis testing using simple linear regression analysis. The variable value coefficient X of 0.841 states that every 1% increase in the value of learning interest will increase by 0.841. Based on the value of the correlation coefficient, the r value is 0.832, which means that variable X has a strong positive correlation with variable Y , the r square value is 69.3%. This means that interest in learning affects learning outcomes by 69.3% and 30.7% is influenced by other variables. Based on the t_{count} value greater than the t_{tabel} value = 2.07387 so that H_0 is rejected and H_a is accepted, which means that there is an effect of interest in learning on students' learning outcomes in learning of sprinting class V at SD Negeri 112 Seluma.

Keywords: Students' Learning Outcomes, Effect of Learning Interest.
